

BSS RAM's with operators for several measures

Christine Gaßner

Greifswald

We deal with questions arising from the comparison of probabilistic BSS machines and other types of machines. For this purpose, we first extend our BSS RAM's over algebraic structures by introducing a nondeterministic ν -operator, and then we define further operators that are useful to compute probability measures for certain sets of problems. Finally we present first results for BSS RAM's over the real numbers.
